

**IN THE SPECIFICATION:**

Please delete the first paragraph on page 12, lines 1-3 and replace it with the following:

---

C/ The fins 26 are arranged in a stack as seen in Figs. 1 and 2 and each fin in the stack has a series of slots 34 that open to one elongated edge 36 of the fin 26 in a direction generally normal to the edge 36. The opposite edge 38 of the fin 26, in the embodiment illustrated in Figs. 1-3, is uninterrupted.

C/ The embodiment illustrated in Figs. 1-3, inclusive, illustrates a single tube row heat exchanger. Figs. 4 and 5 show an embodiment that provides two tube rows in the heat exchanger. In the interest of brevity, identical components will not be redescribed and will be given the same reference numerals. In the embodiment illustrated in Figs. 4 and 5, two each of the headers 20, 22 are employed, one for each tube row. Two rows of the tubes 24 are employed as well and a stack of plate fins 50 are utilized. In the embodiment illustrated in Figs. 4 and 5, the slots 34 are formed in two rows, one opening generally normal to one edge 52 of the fin and the other row opening generally normal to the opposite edge 54 of the fins 50. The slots 34 are dimensioned with respect to the tubes 24 in the same manner mentioned previously and again are provided with louvers 28 between

adjacent ones of the tubes 24. Fabrication is as mentioned previously and by suitable plumbing, the rows may be arranged in hydraulic parallel, in series, or may even be utilized to provide cooling for two different fluids if desired.

CB

Still another embodiment of the invention is illustrated in Figs. 6-8, inclusive. In this embodiment, two tube rows are formed and they are connected in hydraulic series. Again, like components will not be redescribed in the interest of brevity and will be given the same reference numerals as those used previously. In the embodiment of Figs. 6-8, a heat exchanger much like that illustrated in Figs. 1-3 is formed using the fins 26 that are provided with slots 34 opening generally normal to only one edge 36 of the fins 26. In this embodiment, tubes 56 extend between the headers 20, 22. However, the tubes 56 are considerably longer than those illustrated in the embodiment of Figs. 1-3 for a heat exchanger having the same frontal area and two stacks of the fins 26 are used. Each stack is abutted against a corresponding one of the headers 20, 22 leaving a gap, generally designated 58, in the center of the heat exchanger which is characterized by the absence of the fins.
